

Quick Bite — Fast Food Ordering (Case Study)

Quick Bite is a fast food-ordering app concept for college students and office workers. It reduces decision overload and ordering steps with a focused flow: **Menu** → **Cart** → **Checkout**.

Problem

- Users face **too many options** and **too many steps** when ordering food.
- This makes the process **confusing** and slows people down.

Target users

- College students
- Office workers

Goal

- **Reduce time** to place an order

- **Reduce steps** in the flow
- **Improve clarity** throughout ordering

Solution

The app helps users:

- Quickly view the menu
- Easily add items
- Complete checkout fast

User flow

Menu → Cart → Checkout

Key design decisions

1. **Only essential screens** to keep the experience simple.
2. **Show fewer items upfront** to speed up decision-making.
3. **Expandable menu** to balance speed with choice.
 - Tradeoff: limiting options improves speed, but may reduce perceived choice.
 - Handling: users can expand the menu when they want more options.

Final screens

- Menu screen
- Cart screen
- Checkout screen

Benefits

- Order faster
- Reduce confusion
- Simple experience
